THE HAMMOND All-Electric Clock mechanism is rugged, simple of construction, and contains no springs.

EXACT time to the second, always . . . without winding or even regulating . . . that is the newest gift of electricity. Once you know the accuracy maintained by the Hammond Electric Clock you will always refer to it with the assurance that it is bound to be right . . . because it is constantly regulated.

This new clock has no springs, no mechanical escapement. Instead, a small synchronous motor registers the time-impulses sent to it by the electricity from the light socket. It is put into service by merely inserting the plug into any convenience-outlet, setting the hands in the usual manner and starting. Thereafter, the same electricity that drives the clock also regulates it so that it keeps exact time. The current consumed is two watts, a negligible amount that costs less than ten cents per month at the average rate for electricity.

Every model is well designed to suit the purpose for which it is intended. A large sweep second hand is included so that the time can be set to the exact second and a flasher disc shows at a glance that the clock is running. Every home, store and office needs at least one clock that is always right. No winding or regulating.

*Hammond Synchronous Electric Clocks are manufactured under
Hammond Patent No. 1,719,805 and applications.*
